

# Problem 1

---

a.

Given:

$$P(\text{movL} \mid \text{foodL}) = 0.5$$

$$P(\text{movR} \mid \text{foodL}) = 0.2$$

$$P(\text{stay} \mid \text{foodL}) = 0.3$$

$$P(\text{movL} \mid \text{foodR}) = 0.2$$

$$P(\text{movR} \mid \text{foodR}) = 0.5$$

$$P(\text{stay} \mid \text{foodR}) = 0.3$$

$$P(\text{movL} \mid \text{foodHere}) = 0.25$$

$$P(\text{movR} \mid \text{foodHere}) = 0.25$$

$$P(\text{stay} \mid \text{foodHere}) = 0.5$$

Step 0: Ant is in cell 2

Because at this point we don't have any information about where the food might be, we have to assume that there is an equal probability among each cell to hold the location of the food.

$$P(\text{cell}_1 \text{ has Food}) = \dots = P(\text{cell}_5 \text{ has Food}) = 1/5$$

Because we know how the ant is likely to move given where the food is, we can predict how likely each move the can make is using the probability of where the food is.

$P(\text{ant moving in direction A}) =$

$$[P(\text{food being to left}) * P(\text{moving in direction A} \mid \text{food is to the left})$$

$$+ [P(\text{food being to right}) * P(\text{moving in direction A} \mid \text{food is to the right})]$$

$$+ [P(\text{food is at current cell}) * P(\text{moving in direction A} \mid \text{food is in current cell})]$$

$$P(\text{movL}) = [P(\text{foodL}) * P(\text{movL} \mid \text{foodL})] + [P(\text{foodR}) * P(\text{movL} \mid \text{foodR})] + [P(\text{foodHere}) * P(\text{movL} \mid \text{foodHere})]$$

$$= [1/5 * 0.5] + [3/5 * 0.2] + [1/5 * 0.25]$$

$$= 0.1 + 0.12 + 0.05 = 0.27$$

$$P(\text{movR}) = [P(\text{foodL}) * P(\text{movR} \mid \text{foodL})] + [P(\text{foodR}) * P(\text{movR} \mid \text{foodR})] + [P(\text{foodHere}) * P(\text{movR} \mid \text{foodHere})]$$

$$= [1/5 * 0.2] + [3/5 * 0.5] + [1/5 * 0.25]$$

$$= 0.04 + 0.3 + 0.05 = 0.39$$

$$P(\text{stay}) = [P(\text{foodL}) * P(\text{stay} \mid \text{foodL})] + [P(\text{foodR}) * P(\text{stay} \mid \text{foodR})] + [P(\text{foodHere}) * P(\text{stay} \mid \text{foodHere})]$$

$$= [1/5 * 0.3] + [3/5 * 0.3] + [1/5 * 0.5]$$

$$= 0.06 + 0.18 + 0.1 = 0.34$$

$$P(\text{movL}) = 0.27$$

$$P(\text{movR}) = 0.39$$

$$P(\text{stay}) = 0.34$$

$$P(\text{cell}_1 \text{ has food}) = \dots = P(\text{cell}_5 \text{ has food}) = 1/5$$

### Step 1: Ant moves right from cell 2 to cell 3

Because the ant moved from cell 2 to cell 3, the probability of the food being in each cell needs to be updated given the fact that the ant moved right.

For each cell i:

$$P(\text{cell}_i \text{ now has food after step 1}) = P(\text{cell}_i \text{ had food in previous step} \mid \text{ants current move})$$

$$\begin{aligned} P(\text{cell}_1 \text{ has food} \mid \text{movR}) &= P(\text{cell}_1 \text{ has food}) * P(\text{movR} \mid \text{cell}_1 \text{ has food}) / P(\text{movR}) \\ &= (1/5) * P(\text{movR} \mid \text{FoodL}) / 0.39 \\ &= (1/5) * 0.2 / 0.39 \\ &= 0.1026 \end{aligned}$$

$$\begin{aligned} P(\text{cell}_2 \text{ has food} \mid \text{movR}) &= P(\text{cell}_2 \text{ has food}) * P(\text{movR} \mid \text{cell}_2 \text{ has food}) / P(\text{movR}) \\ &= (1/5) * P(\text{movR} \mid \text{FoodHere}) / 0.39 \\ &= (1/5) * 0.25 / 0.39 \\ &= 0.1282 \end{aligned}$$

$$\begin{aligned} P(\text{cell}_3 \text{ has food} \mid \text{movR}) &= P(\text{cell}_4 \text{ has food} \mid \text{movR}) = P(\text{cell}_5 \text{ has food} \mid \text{movR}) \\ &= P(\text{cell}_3 \text{ has food}) * P(\text{movR} \mid \text{cell}_3 \text{ has food}) / P(\text{movR}) \\ &= (1/5) * P(\text{movR} \mid \text{FoodR}) / 0.39 \\ &= (1/5) * 0.5 / 0.39 \\ &= 0.2564 \end{aligned}$$

After Step 1:

$$\begin{aligned} P(\text{cell}_1 \text{ has food}) &= 0.1026 \\ P(\text{cell}_2 \text{ has food}) &= 0.1282 \\ P(\text{cell}_3 \text{ has food}) &= 0.2564 \\ P(\text{cell}_4 \text{ has food}) &= 0.2564 \\ P(\text{cell}_5 \text{ has food}) &= 0.2564 \end{aligned}$$

We can now calculate with what probability the ant will move next. Because we know the ant moves right in the next step, we only calculate the probability of the ant moving right because that is the only probability needed to determine the location of where the food might be.

$$\begin{aligned} P(\text{movR after step 1}) &= [P(\text{FoodL}) * P(\text{movR} \mid \text{FoodL})] + [P(\text{FoodR}) * P(\text{movR} \mid \text{FoodR})] + [P(\text{FoodHere}) * P(\text{movR} \mid \text{FoodHere})] \\ &= [P(\text{cell}_1 \text{ has food} \vee \text{cell}_2 \text{ has food}) * 0.2] + [P(\text{cell}_4 \text{ has food} + P(\text{cell}_5 \text{ has food})) * 0.5] + [P(\text{cell}_3 \text{ has food}) * 0.25] \\ &= [(0.1026 + 0.1282) * 0.2] + [(0.2564 + 0.2564) * 0.5] + [(0.2564) * 0.25] \\ &= 0.04616 + 0.2564 + 0.0641 \\ P(\text{movR}) &= 0.3667 \end{aligned}$$

The probability that the ant moves again in step 2 is 0.3667

### Step 2: Ant moves right from cell 3 to cell 4

$$\begin{aligned} P(\text{cell\_1 has food} \mid \text{movR}) &= P(\text{cell\_2 has food} \mid \text{movR}) \\ &= P(\text{cell\_1 has food}) * P(\text{movR} \mid \text{cell\_1 has food}) / P(\text{movR}) \\ &= (0.1026) * P(\text{movR} \mid \text{foodL}) / 0.3667 \\ &= (0.1026) * 0.2 / 0.3667 \\ &= 0.056 \end{aligned}$$

$$\begin{aligned} P(\text{cell\_3 has food} \mid \text{movR}) &= P(\text{cell\_3 has food}) * P(\text{movR} \mid \text{cell\_3 has food}) / P(\text{movR}) \\ &= (0.2564) * P(\text{movR} \mid \text{foodHere}) / 0.3667 \\ &= ((0.2564) * 0.25) / 0.3667 \\ &= 0.1748 \end{aligned}$$

$$\begin{aligned} P(\text{cell\_4 has food} \mid \text{movR}) &= P(\text{cell\_5 has food} \mid \text{movR}) \\ &= P(\text{cell\_4 has food}) * P(\text{movR} \mid \text{cell\_4 has food}) / P(\text{movR}) \\ &= (0.2564) * P(\text{movR} \mid \text{FoodR}) / 0.3667 \\ &= (0.2564) * 0.5 / 0.3667 \\ &= 0.3496 \end{aligned}$$

After Step 1:

$$\begin{aligned} P(\text{cell\_1 has food}) &= 0.056 \\ P(\text{cell\_2 has food}) &= 0.056 \\ P(\text{cell\_3 has food}) &= 0.1748 \\ P(\text{cell\_4 has food}) &= 0.3496 \\ P(\text{cell\_5 has food}) &= 0.3496 \end{aligned}$$

[note: the reasoning these add up to 0.98 must be due to some rounding error.]

I can check back my results but I think this working towards the right path.
